

# ***AIR-OVER-OIL AUTOMATIC CHAIN CONVEYOR TAKE-UP CONTROL SYSTEM!***

Engineer designed take-up control and chain pull monitoring system has proven itself in over forty years of service in auto plants in the U.S., Canada and the U.K.

The system allows normal movement of the take-up traction wheel to maintain proper predetermined tension in the conveyor chain.

In the event of electrical or air supply failure, the system automatically hydraulically locks the tensioning cylinder in place, thus preventing uncontrolled extension of the cylinder, and subsequent chain falling off the traction wheel creating a costly and time consuming maintenance repair problem.

These control systems are built with top quality components giving many years of maintenance free service.

Call and talk to our sales department today for further information on our take-up systems:
